

ClanMind — Complete E2E Verification Report

Every Screen · Every Feature · Every Artifact · Real Data · Real Interactions

Generated: 2026-08-26 | Backend: CF Worker :8787 | Frontend: Vite :1420

User: atom-test@clanmind.test (OWNER) | Group: SIH 2026 - Team Innovators | Project: Smart Water Management

36 unique screenshots · 10 views · 5 artifact types rendered · 13 settings sections · 6 bugs fixed

Bugs Fixed This Session (6)

1. **Artifacts not loading** — bootstrapLiveGroups() picked wrong group. URL-aware selection + loadFeatureStores on switch. ✓
2. **Settings AI/Members invisible** — members[] never populated; myRole=null. Mapped API members with roles. ✓
3. **Members API type mismatch** — Extended generic with role/joined_at. ✓
4. **Artifact viewer version warning** — fetchArtifact didn't fetch versions; content_ref not mapped. Separate endpoint + direct mapping. ✓
5. **Artifact shows v1 not latest** — activeVersionNumber=1 from store default. Skip find() when fetchedVersions available. ✓
6. **CODE/HTML artifacts unsupported** — No case in viewer switch. Added to DOC_TYPES. ✓

Commits Pushed (8)

SHA	Message
a17efd6	fetchArtifact bypasses schema for reliable version content
ad1c4c7	artifact viewer always shows latest version
54d843f	artifact viewer uses fetched versions directly
51af485	artifact current_version NaN after merge
f2ec3c8	add CODE/HTML/OTHER to artifact document types
a3780fa	artifact viewer fetches versions and renders content
57e4aaf	artifact viewer shows version warning instead of content
b80d669	artifacts not loading + settings role-gating broken

Project: SIH 2026 — Smart ...

4 here

S1[IOT_Sensor Node\nnpm\nhumidity/uu] -->[MQTT] B

S2[IOT_Sensor Node\nConductivity/Temp] -->[MQTT] B

%% Core Components

B[[MQTT Broker\n(EMQX Recommended)]] --> P[Data Pipeline]

P -->[Process & Enrich] T[(Time-Series DB\nInfluxDB/TimescaleDB)]

T --> A[REST API/GraphQL]

%% Outputs

A --> D[Realtime Dashboard\n(Grafana/Superset)]

A --> M[ML Anomaly Detection]

A --> N[Notification System]

%% External

D --> U[Utility Operators]

M -->[Alerts] U

Key Flow Explanation:

1. **Edge Layer:** Sensor nodes transmit via MQTT (optimal for constrained devices)

2. **Ingestion:** EMQX broker handles 100K+ concurrent connections

3. **Pipeline:** Data validation + enrichment (e.g., adding location metadata)

4. **Storage:** Time-series optimized for sensor data patterns

5. **Serving:** Single API layer for all consumers

6. **Consumption:** Unified dashboard with alerting

Would you like me to:

1. Add specific protocols (e.g., MQTT over TLS)

2. Detail the pipeline transformation logic

3. Compare dashboard tools

4. Make any adjustments to this flow?

4 here

```
S1[IoT Sensor Node\npH/Conductivity/DO] -->|MQTT| B
S2[IoT Sensor Node\nConductivity/Temp] -->|MQTT| B
```

%% Core Components

```
B[MQTT Broker\n(EMQX Recommended)] --> P[Data Pipeline]
P -->|Process & Enrich| T[(Time-Series DB\nInfluxDB/TimescaleDB)]
T --> A[REST API/GraphQL]
```

%% Outputs

```
A --> D[Realtime Dashboard\n(Grafana/Superset)]
A --> M[ML Anomaly Detection]
A --> N[Notification System]
```

%% External

```
D --> U[Utility Operators]
M -->|Alerts| U
```

Key Flow Explanation:

1. **Edge Layer:** Sensor nodes transmit via MQTT (optimal for constrained devices)
2. **Ingestion:** EMQX broker handles 100K+ concurrent connections
3. **Pipeline:** Data validation + enrichment (e.g., adding location metadata)
4. **Storage:** Time-series optimized for sensor data patterns
5. **Serving:** Single API layer for all consumers
6. **Consumption:** Unified dashboard with alerting

Would you like me to:

1. Add specific protocols (e.g., MQTT over TLS)
2. Detail the pipeline transformation logic
3. Compare dashboard tools
4. Make any adjustments to this flow?
