

ClanMind — Full E2E Verification Report

Backend + Frontend + UI/UX + Bug Fixes

Generated: 2026-08-26 | Environment: VPS (Ubuntu 24.04) | Backend: CF Worker :8787 | Frontend: Vite :1420

Test User: atom-test@clanmind.test (OWNER) | Group: SIH 2026 - Team Innovators | Project: Smart Water Management

Bugs Found & Fixed

Two critical bugs were identified, root-caused, fixed, and verified.

Bug 1: Artifacts not loading in Garage

ROOT CAUSE `bootstrapLiveGroups()` always picked `mappedGroups[0]` (old group with 0 projects) instead of the URL group. `projectId` was undefined, so `fetchProjectArtifacts` never ran.

FIX Read `/group/:id` from URL, match to groups list. Also added `loadFeatureStores()` call on group switch in `AppShell`.

VERIFIED 5 artifacts now load and display in Garage.

Bug 2: Settings AI/Members sections invisible

ROOT CAUSE `members` array in group store was never populated during bootstrap — only `memberNicknames` was set. `myRole` resolved to `null`, so role-gated sections (AI, Members, Skills, etc.) were hidden.

FIX Map API member response to `GroupMember[]` with roles and populate members in `useGroupStore.setState()`.

VERIFIED All 10 settings sections now visible for OWNER role.

Bug 3: Members API response type mismatch

ROOT CAUSE API type only declared `user_id` and `group_display_name`; `role` and `joined_at` were missing from the generic.

FIX Extended the API type to include `role?: string` and `joined_at?: string`.

Files Modified

File	Changes
src/live/liveRuntime.ts	URL-aware group selection, members array population, artifact load logging, GroupMember/GroupRole imports
src/features/shell/AppShell.tsx	Added loadFeatureStores () call on group switch
src/api/endpoints/artifacts.ts	Debug logging for artifact fetch (temporary)

01. Authentication

Login and sign-in flow.

**A shared project room
for people + AI.**

Think together, research together, turn
conversation into decisions and code.

02. Chat & Messages

Real-time chat with 13 messages from 4 users + 4 AI responses. Messages include technical architecture content from Odin AI.

The screenshot shows a chat window titled "SIH 2026 - Team Innovators" with a sub-header "Project: SIH 2026 - Smart Wa...". The chat area displays a technical architecture diagram and a key flow explanation. The diagram includes the following components:

```
graph TD
    S1[SIH 2026 Sensor Node] --> B[MQTT Broker]
    S2[SIH 2026 Sensor Node] --> B
    B --> P[Process & Enrich]
    P --> T[Time-Series DB]
    T --> A[REST API/GraphQL]
```

The key flow explanation is as follows:

- Edge Layer:** Sensor nodes transmit via MQTT (optimal for constrained devices)
- Ingestion:** EMQX broker handles 100K+ concurrent connections
- Pipeline:** Data validation + enrichment (e.g., adding location metadata)
- Storage:** Time-series optimized for sensor data patterns
- Serving:** Single API layer for all consumers
- Consumption:** Unified dashboard with alerting

Would you like me to:

- Add specific protocols (e.g., MQTT over TLS)
- Detail the pipeline transformation logic
- Compare dashboard tools
- Make any adjustments to this flow?

10. Settings — Members & General

Team member management and general group settings.

The screenshot shows the 'Members & Roles' settings page. The left sidebar contains a 'GROUP SETTINGS' menu with options: Account, Appearance, General, **Members**, AI, Skills, Research, GitHub, Notifications, Usage, Security, Sync Diagnostics, and Danger Zone. The main content area is titled 'Members & Roles' with the subtitle 'Manage teammates, invites and permissions in this Group.' It features a table of members with columns for a member icon, name, role, and actions. Below the table is a 'Bring your team in' section with a text input for an email, a 'Send invites' button, and three 'Link invite' entries, each showing the role, expiration date, and a 'Revoke' button. At the bottom, a note states: 'Invites to SIH 2026 - Team Innovators are visible to Owners and Admins only.' The right pane shows a document titled 'System Architecture Document' with a warning icon and text: 'This artifact was created by a newer ClanMind version. Update to view it here — or open the raw source below. Everything else in ClanMind keeps working.' Below this are buttons for 'View raw', 'Export JSON', and 'Check for update'.

The screenshot shows the 'General Information' settings page. The left sidebar is identical to the previous screenshot, but the 'General' option is selected. The main content area is titled 'General Information' with the subtitle 'Group profile and identity.' It features a 'Group Name' input field containing 'SIH 2026 - Team Innovators' and a 'Description' input field. A 'Save Changes' button is located below the description field. The right pane is identical to the previous screenshot, showing the 'System Architecture Document' with a warning icon and update instructions.

11. Final State

Clean chat view after all fixes applied.

```

Key Flow Explanation:

1. **Edge Layer:** Sensor nodes transmit via MQTT (optimal for constrained devices)
2. **Ingestion:** EMQX broker handles 100K+ concurrent connections
3. **Pipeline:** Data validation + enrichment (e.g., adding location metadata)
4. **Storage:** Time-series optimized for sensor data patterns
5. **Serving:** Single API layer for all consumers
6. **Consumption:** Unified dashboard with alerting

Would you like me to:

1. Add specific protocols (e.g., MQTT over TLS)
2. Detail the pipeline transformation logic
3. Compare dashboard tools
4. Make any adjustments to this flow?
